Table of Contents:

Section I  Overview and Methods
1. Gene therapy methods and their applications in neurological disorders
2. Targeting transgene and RNA interference-based gene silencing sequences to astrocytes using viral vector-mediated approaches
3. Gene therapy using genomic DNA: Advances and challenges
4. Stem cell-based gene therapy in neurological disorders

Section II  Approaches to specific disorders
5. Targeting astrocytes with viral gene therapy for Alzheimer’s disease
6. Prophylactic and therapeutic applications of catalytic immunoglobulin gene delivery in a mouse model of Alzheimer’s disease
7. Lentiviral vector delivery of orexin gene to study potential role of orexin and sleep modulation in the pathogenesis of Alzheimer’s disease
8. Pharmacologically controlled neurotrophic factor gene therapy for Parkinson’s Disease
9. Gene therapy as a novel target for treatment of symptoms and medication complications in Parkinson’s disease
10. Inhibition of aggregation of mutant huntingtin by nucleic acid aptamers in vitro and in a yeast model of Huntington’s disease
11. Intraspinal delivery of recombinant AAV mediated Interleukin-10 modifies disease in ALS mice.
12. Differentiation of human induced pluripotent stem cells to Purkinje neurons
13. Expressing full-length dystrophin using adeno-associated virus
14. Genome editing therapy for Duchenne muscular dystrophy
15. AAV vector mediated gene delivery to neurons and glial cells in damaged spinal cord
16. Transplantation of human induced pluripotent stem cell-derived neural precursor cells for treatment of spinal cord injury
17. Viral transduction of primary Schwann cells using a Cre-lox system to regulate GDNF expression
18. Application of Herpes simplex virus vectors in treatment of neuropathic pain
19. Oncolytic virotherapy for gliomas: a preclinical and clinical summary
