

Table of Contents:

SECTION ONE: THE STORY OF MULTIPLE SCLEROSIS

1. The story of multiple sclerosis

The evolving concept of multiple sclerosis
Naming and classifying the disease: 1868-1983
Clinical descriptions of multiple sclerosis: 1838-1981
Personal accounts of multiple sclerosis: 1824-1991
The social history of multiple sclerosis: 1945-1998
The pathogenesis and clinical anatomy of multiple sclerosis:
1849-1977
The laboratory science of multiple sclerosis: 1912-1981
Discovery of glia and remyelination: 1858-1988
The aetiology of multiple sclerosis: 1883-1976
Attitudes to the treatment of multiple sclerosis: 1841-1983

SECTION TWO: THE CAUSE AND COURSE OF MULTIPLE SCLEROSIS

2. The distribution of multiple sclerosis

The rationale for epidemiological studies in multiple sclerosis
Definitions and statistics in epidemiology
Strategies for epidemiological studies in multiple sclerosis
The geography of multiple sclerosis
Epidemics and clusters of multiple sclerosis
The environmental factor in multiple sclerosis

3. The genetics of multiple sclerosis:

Genetic analysis of multiple sclerosis
Methods of genetic analysis
Racial susceptibility
Sex differences in susceptibility
Familial multiple sclerosis
Candidate genes in multiple sclerosis
Systematic genome screening
Lessons from genetic studies of experimental allergic encephalomyelitis
Conclusions

4. The natural history of multiple sclerosis

Introduction
Definitions
Onset
Course

Inter-individual variability
Factors affecting the prognosis
General considerations
Environmental influences

Chapter 5: The aetiology of multiple sclerosis: an epitome

SECTION THREE: THE CLINICAL FEATURES AND DIAGNOSIS OF MULTIPLE SCLEROSIS

6. The symptoms and signs of multiple sclerosis.

Multiple sclerosis as a neurological illness

Initial symptoms
Symptoms and signs in the course of the disease
Individual symptoms and sign
Associated diseases
Conclusion

7. The diagnosis of multiple sclerosis

Diagnostic criteria for multiple sclerosis
Selection of investigations
Magnetic resonance imaging
Evoked potentials
Examination of the cerebrospinal fluid
A strategy for the investigation of demyelinating disease

8. The differential diagnosis of multiple sclerosis

The spectrum of disorders mimicking multiple sclerosis
Diseases that may cause multiple lesions of the CNS and also often follow a relapsing remitting course
Systematized central nervous system diseases
Isolated or monosymptomatic CNS syndromes
Non organic symptoms
How accurate is the diagnosis of multiple sclerosis?

9. Multiple sclerosis in the individual and in groups: a conspectus

The typical case
Isolated syndromes and their outcome: judicious use of investigations and critique of the new diagnostic criteria
Co-morbidity and associated diseases
Situations in which alternative diagnoses should be considered
When to ignore "inconvenient" laboratory results or clinical findings: taking the best position
"Pathognomonic" and "un-heard of" features of multiple

sclerosis

SECTION FOUR: THE PATHOGENESIS OF MULTIPLE SCLEROSIS

10. The neurobiology of multiple sclerosis.

Organisation in the central nervous system
Development of the central nervous system
Macroglial lineages in the rodent and human nervous system
Axon-oligodendrocyte interactions and myelination
Demyelination
Axonal degeneration and restoration of function
Remyelination

11. The immunology of inflammatory demyelinating disease

Multiple sclerosis as an autoimmune disease
Immune responses: innate and adaptive
T lymphocytes
B lymphocytes
Autoimmunity and self tolerance in the central nervous system
Regulation of central nervous system autoimmune responses
Immune reactivity in the central nervous system
Pathogenesis of demyelination and tissue damage
Peripheral blood biomarkers for multiple sclerosis and disease activity
Markers of multiple sclerosis and disease activity in cerebrospinal fluid
Conclusion

12. The pathology of multiple sclerosis

Introduction
Pathological classification of demyelinating diseases
The demyelinated plaque
Immunopathology of inflammation
Demyelination and oligodendroglial damage
Remyelination
Axonal pathology
Grey matter pathology / cortical plaques
Astroglia reaction
Abnormalities in the "normal" white matter
Distribution of lesions in the nervous system
Is there evidence for an infectious agent in the lesions of multiple sclerosis?
Dynamic evolution of multiple sclerosis pathology

Differences between acute relapsing and progressive multiple sclerosis
Molecular approaches to the study of the MS lesion: Global profiling of transcriptome and proteome.
Association of multiple sclerosis with other diseases
Conclusions

13. The pathophysiology of multiple sclerosis

Introduction
Methods for exploring the pathophysiology of multiple sclerosis
Relapsing remitting multiple sclerosis: loss of function due to conduction block
Relapsing remitting multiple sclerosis: recovery of function and remission
Physiological explanations for other clinical symptoms in multiple sclerosis
Permanent loss of function in the context of disease progression
Summary

SECTION FIVE: THE TREATMENT OF MULTIPLE SCLEROSIS

15. Care of the person with multiple sclerosis

General approach to the care of people with multiple sclerosis
The early stages of disease: minimal disability
The middle stages of disease: moderate disability
The later stages of disease: severe disability
Guidelines for the management and investigation of multiple sclerosis
Conclusion

16. Treatment of the acute relapse

The features of active multiple sclerosis
The treatment of relapse in multiple sclerosis
Other approaches to the treatment of acute relapse
Treatment of acute optic neuritis
Management of other central nervous system demyelinating disorders
Adverse effects of corticosteroids
Mode of action of corticosteroids
Practice Guidelines

17. The treatment of symptoms in multiple sclerosis and the role of rehabilitation

The general principles of symptomatic treatment in multiple

sclerosis
Disturbances of autonomic function
Mobility and gait disturbance
Fatigue
Disturbances of brain stem function
Perturbations of nerve conduction
Cognition
Visual symptoms
Rehabilitation in multiple sclerosis
Summary

18. Disease modifying treatments in multiple sclerosis

The aims of disease modifying treatment
The principles of evidence based prescribing in multiple sclerosis
The role of magnetic resonance imaging in clinical trials
Drugs that stimulate the immune response
Drugs that non-specifically suppress the immune response
The beta interferons
Molecules that inhibit T cell-peptide binding
Specific treatments that target T cells
Agents which inhibit macrophages and their mediators
Recent miscellaneous treatment
Postscript

19: The person with multiple sclerosis: present and future

Empirical versus hypothesis driven therapeutics
New opportunities for immunological intervention
Axon protection; acute and chronic
Treatment in special situations
Remyelination:
